Fetch request

- send network requests
- load new information from server

let promise = fetch(url, [options])

url = the URL to access

options = optional parameters, methods, headers, etc.

① Resolves with an object of the built-in Response class as soon as the server responds w/ headers

② we need to use an additional method call to get the response body

CORS

- Cross origin resource sharing protects the internet
- for many years a script from one site could not access the content of another site ... however...

tricks

using forms

SAFE requests < GET, POST, HEAD } methods

using scripts

can be made

Origin header =

domain/protocol/port

with a form

or script tag

without any special

methods
